Current Amplifier

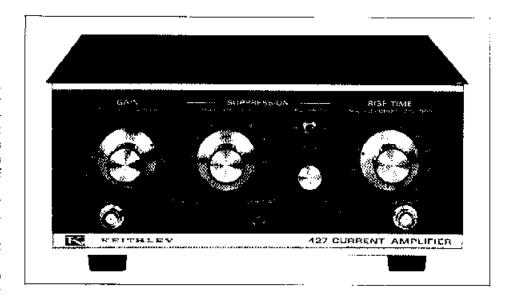

- High speed—as fast as 15μs
- Current suppression
- Low noise

The Keithley Model 427 amplifier provides high speed combined with low noise and selectable gain, current suppression, and rise time. It is the fastest Keithley picoammeter, with rise times as fast as 15µs at 10°V/A gain. Rise times as fast as 1.5ms at the maximum gain of 10°11V/A may be selected.

By selecting slower rise times, wider dynamic range and lower noise are obtained: at  $10^{11}$ V/A gain, noise of  $3 \times 10^{-13}$ A rms is achieved, with a dynamic range of 13,000:1.

The built in current suppression with 10-turn resolution permits compensation of large steady-state currents to observe small changes on a more sensitive range. Eight decade ranges of current suppression are provided, from  $10^{-10}$  to  $10^{-3}$ A.

Transient overloads up to 1000V are absorbed without damage, and to prevent unrecognized distortion, the 427

gives visible indication of all overloads.

These features, plus the 427's combination of speed, dynamic range, and sensitivity, make it extremely useful with scanning electron microscopes, sensitive spectrum analyzers, mass

spectrometers, and photomultiplier systems. It is also widely used for measurement of photo effects in biological systems and membrane transport studies, as well as measurement of beam currents and semiconductor properties.
